Kirby Inu MCSE based on Shiba Inu 10% ETH rewards for holding!

Kirby Inu How It Works

TOKENOMICS

- 100 TRILLION TOKENS
- 10% ETH REFLECTIONS
- 2% DEV FEE
- 1% FTP DEV FEE

On every buy / sell Kirby Inu sucks up 10% of the Ethereum and stores it in FTP (Fair Token Project) proprietary Ethereum Redistribution Smart Contract. Investors earn their share based on the ratio of tokens that they currently hold at the time of a buy / sell.

For example if there was a holder with 1% of the \$KIRBY supply (1 Trillion) then that holder would earn \$1000 worth of Ethereum in Redistribution for every \$1,000,000 in trading volume

Kirby Inu FREE NFTs for Holding

NFT MINTS SEVERY 100 BILLION KIRBY INU = 1 FREE NFT

There is a total of 100 Trillion Kirby Inu tokens meaning if all tokens were being held by investors, then there can be a total of 1,000 NFTs. This is by design to encourage trading and volume as NFTs can only be minted once per wallet.

The rules of the Kirby Inu NFTs are the for every 100 Billion Kirby Inu tokens you hold, that equals 1 NFT. So if you sold 2 Trillion Kirby Inu Tokens you can mint 20 NFTs (one-time) for that wallet. If you transfer your 2 Trillion Kirby Inus to another wallet you will incur a 13% tax which adds to the volume of Kirby Inu. That new wallet can also mint NFTs, but now you will only have 1.66 Trillion Kirby Inu tokens which can yield 16 NFTs. The first set of NFTs will be Ugly Baby Kirby Themed with a total supply of 10,000 ERC-721 Tokens that are unique.

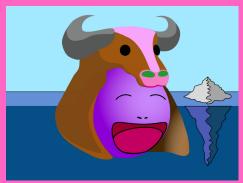

The NFTs will be tradable on any NFT marketplace (that accepts ERC-721) as they will be ERC-721 compliant.

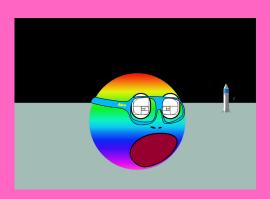

Note: The only wallet supported to mint NFTs will be Metamask through the Kirby Inu website. If you want to use another wallet you can mint the tokens directly via Etherscan.
